Day 34

Backend

- Signup
 - o Controller receives the data like username, password, email, etc.
 - Controller passes the data to service
 - Service checks if the data are valid or not and returns the message accordingly. [Server-side validation]
- Login
 - o Controller receives the username and password
 - o Checks if username and password are empty or not
 - Now, if username and password both are admin then return login successful otherwise login failed.

Frontend

- Create signup form with username, password, email, etc., as fields
- When signup button is clicked, pass the data to backend for signup
- Display the message returned by the API.
- Create login form with username and password as fields
- When login button is clicked, pass the data to backend for login
- Display the message returned by the API
- Now, validate the data in the frontend before sending it to backend [Client-side validation]
- When signup button is clicked check if username, password, email are empty or not, if empty display the message without sending the signup request to backend
- Perform similar action for login process
