Day 31

Create a spring boot application with the following features:

- **Signup**
    - Controller receives the data like username, password, email, etc.
    - Controller passes the data to service
    - Service validates the data and stores in the database if the data are valid otherwise suitable message will be returned
    - Repository layer will store the valid data received from the service

- **Login**
    - Controller receives the username and password
    - Checks if username and password are correct and then returns the suitable message
    - Perform the required action in service and repository layer
